Cleaning Reports

**Great
Lakes**
TV SEAL INC.

**CLEVER
SCAN**

Heart of the Valley Metropolitan Sewerage District

Location: River Siphon

Great Lakes TV Seal, Inc. is now performing CleverScan manhole inspections. Let us bring an HD virtual tour of the manhole to your office. Software is included at no charge to allow you to take manhole measurements such as circumference, distance, diameters and more right at your desk! With a CleverScan manhole inspection, you have the ability to enter the manhole at any time right from your office and pan every inch of the structure in any direction, all with a cup of coffee in hand! You make the judgement calls, not a field technician. Call us today for details!

CLEANING REPORT

DATE: 9/10/2018
 OWNER: Heart of the Valley Metropolitan Sewerage District
 LOCATION: River siphon
 CONTRACTOR: _____
 TYPE: Sanitary

SECTION MH TO MH		PIPE SIZE (inch)	PIPE LENGTH (feet)	REMARKS:
39A	38A	30	620	The siphon is highly septic and contains heavy amounts of paper and organic solids. The hose returned with large clumps of paper, hair, and string.
				As we worked our hose toward the upstream side, with every
				pass we noticed our hose started returning with grease on it. Only the top
				200' of hose returned with grease. A small amount of gravel and grit was
				retrieved on the first few full passes. The line was then cleaned for several
				more hours until the sewage no longer smelled septic and the color
				matched that of the 16" siphon.
				The 6" and 16" leg of sewer was plugged at MH 39 sending all the flow thru
				the 30" while cleaning. No flow was noticed in siphon chamber 38
				during this time.

CLEANING REPORT

DATE: 9/11/2018
OWNER: Heart of the Valley Metropolitan Sewerage District
LOCATION: River siphon
CONTRACTOR: _____
TYPE: Sanitary

SECTION MH TO MH		PIPE SIZE (inch)	PIPE LENGTH (feet)	REMARKS:
39	38	6	618	The 6" siphon was plugged upon arrival. We retrieved free floating grease cakes from this line, but did not see any settled solids.
39	38	16	618	Retrieved a small amount of grit and grease. We jetted this line until the black water subsided and the sewage color matched that of the 6".
				The 30" siphon was plugged on the upstream side sending all the flow thru the 6" and 16" while cleaning. No flow was noticed in siphon chamber 38A during this time.
